APPLICATION REVIEW CHECKLIST

What belongs in a reviewable application file?

A useful packet lets the manager trace each value, inspect the configured criteria and see unresolved evidence before recording a rental decision.

Start with a stable identity

Match the household and property through trusted references before processing documents.

An ambiguous match goes to a person; a language model must not assign evidence to an applicant.

THE SOURCE CONTEXT

Keep the amount beside its source

For each extracted value, retain the document, field or location, income basis and period.

The reviewer should be able to check the original, not trust a floating number.

THE CRITERIA EVIDENCE

Show the rule and its evidence

Record the configured criterion, relevant value and resulting classification together.

Separate this from the manager's decision; a model shouldn't invent a threshold or recommend an outcome.

Make missing evidence explicit

List what is missing, who owns the follow-up and which approved evidence route is available.

Don't fill a blank with an inference to make the summary look finished.

Keep conflicting values visible

Preserve both sources and their definitions.

A gross-versus-net mismatch needs explanation; replacing them with one tidy number hides the reason the file requires review.

— THE HUMAN ACTION

Log the human action separately

Record the authorized reviewer, time, decision and relevant approved conditions in the restricted application record.

Reading output and criteria classifications do not count as human approval.

A REUSABLE REVIEW PACKET

Build the review packet around questions

Which household?

What evidence?

Which rule?

What's unresolved?

Who acts next?

Where is the decision recorded?

Put those answers together without exposing sensitive documents in routine chat.

A PRACTICAL REVIEW TEST

Test whether the file is reviewable

Pick one synthetic or properly redacted example. Trace a value to its source, explain a rule result and find the human action.

Any missing link becomes a process fix.
