APPLICATION REVIEW CHECKLIST

What belongs in a reviewable application file?

Let managers trace each value, inspect configured criteria and see unresolved evidence before recording a rental decision.

Start with a stable identity

Match household and property through trusted references before processing documents.

Ambiguous matches need human review; a model mustn't assign applicant evidence.

THE SOURCE CONTEXT

Keep the amount beside its source

Retain the document,

field or location,

income basis and period for each value.

Let reviewers check the original, not a detached number.

Show the rule and its evidence

Record together:

Configured criterion.

Value.

Classification.

Keep the manager's decision separate; models mustn't invent thresholds or recommend outcomes.

— THE UNRESOLVED WORK

Make missing evidence explicit

List missing evidence, its follow-up owner and the approved evidence route.

Don't fill blanks with inference to make a summary look finished.

Keep conflicting values visible

Preserve both sources and their definitions.

Explain gross-versus-net differences; combining them into one number hides why the file needs review.

— THE HUMAN ACTION

Log the human action *separately*

Record the authorized reviewer, time, decision and approved conditions in the restricted application record.

Reading output and criteria results aren't human approval.

Build the review packet around questions

Which household?

What evidence?

Which rule?

What's unresolved?

Who acts next?

Where is the decision recorded?

Keep answers together; don't expose sensitive documents in routine chat.

A PRACTICAL REVIEW TEST

Test whether the file is reviewable

Use one synthetic or properly redacted example. Trace a value's source, explain a rule result and locate the human action.

Any missing link needs a process fix.
